GUIDE TO TRIVIAL NAMES, TRADE NAMES AND SYNONYMS  
FOR SUBSTANCES USED IN ANALYTICAL CHEMISTRY

APPROVED WARSAW 1977

INTRODUCTION

Any analyst who encounters for the first time a new procedure for determining heavy metals may well feel baffled if he is advised to carry out a titration in a urotropine buffer with complexon IV using sulfarsazen as an indicator. How should he proceed when recommended to carry out a liquid-liquid extraction with a solution of Aliquat-336 in hexone or IBMK after adding BAL as a masking agent? How does he find out whether Calcion is the same as Calcichrome, or Erio T the same as Solochrome Black WDFA; whether there is a significant difference between MBTH and MBTHA, between Magneson I and Magneson II, or between Titan Yellow and Clayton's Yellow?

The following list of trivial names and synonyms has been produced with these problems in mind. It is certainly not exhaustive. Acid-alkali indicators have been omitted and of the numerous commercial and synthetic dyestuffs only those frequently referred to in papers dealing with complexometric titrations have been included. The same restriction applies to the many tetrazolium salts used as redox indicators and to which trivial names have been given. Organic scintillators, ion-exchange resins, stains, and reagents specifically used in biochemical procedures are not included.

When more than one trivial name or synonym is used for a particular substance, all alternatives are given without any proposed preference. The list that follows is intended only as a guide to identifying the chemical composition of substances used in analytical chemistry, and is not to be taken as implying IUPAC approval or recommendation for the names themselves, nor as modes for naming other analogous compounds.

The collection of material for this report was begun by R. W. Fennell in 1965 and continued by members of Commission V.3 and Professor H. M. N. H. Irving who is responsible for the present report. Special thanks are due to Dr. K. L. Loening of the American Chemical Society, Chemical Abstracts Service, for his careful checks on the correctness and consistency of the organic nomenclature and for many valuable comments.
